

## Tasks completed

- Remove the item with “trashcan” icon in cart-detail.html
- Carousel in the bottom of product-detail.html

## Reflections:

- Always remember the syntax correctly. For example, it's “getElementById” and not “getElementByID”, and “getElementsByClassName” instead of “getElementByClassName”.
- Atom live server saves me a lot of time from refreshing the page back and forth
- It's much easier to use chrome developer's tool to try CSS, make sure the code can do what you want to achieve, double-check, and write it in style.css
- Add the script file `<script type="text/javascript" src="js/main.js"></script>` in the end of the html code, otherwise sometimes it will fail to load

## Programming Concepts (5 points)

1. Basic JQuery selector with “\$” sign

```
$(document).ready(function(){  
  $("p").click(function(){  
    $(this).hide();  
  });  
});
```

2. parentElement and childElement

Remove the div when click the button:

```
buttonClicked.parentElement.parentElement.remove();
```

3. Value increments when hitting a button

```
document.getElementById('number').value, 10
```

4. JS has different ways to write a function, and they all work the same

5. In `element.addEventListener(event, function, useCapture);`

the first parameter of event listener is a HTML DOM Event, for example, ‘click’
